

IN THE ABSTRACT

Please amend the abstract as follows (the changes are shown with ~~strike through~~ for deleted matter and underlines for added matter).

A device for subcutaneous administration of a medicament to a patient is disclosed, ~~comprising~~ including a cannula housing (4) with an interior chamber, a cannula (2) connected to said the cannula housing (4) and being in flow communication with the interior chamber, a flexible tubing (4) having a first end (4') and a second end (4''), the first end being ~~wherein the tubing (4) is, at the first end (4'),~~ coupled to the cannula housing (4) such that the tubing (4) is in flow communication with the interior chamber, and wherein, at its other end (4''), the tubing the second end carries a source coupling (5), ~~whereby the tubing (4) can be coupled to a source for said medicament for~~ coupling the tubing to the medicament. ~~The invention is characterised in that the tubing (4) is, between the first and the second end (4', 4''), is folded (9, 9') for forming a configuration with at least two essentially parallel courses (14, 24, 34) of tubing, that the tubing (4) is secured in said the configuration by means of a first holder device (10) arranged between the first and second end (4', 4'') of the tubing; and that the tubing (4) can be displaced in relation to said the first holder device (10) for varying the length of said the courses (14, 24, 34) of tubing.~~
